Abstract (en)

[origin: WO2015121088A1] The present invention relates to a drive arrangement having a hinge which comprises a first hinge arm and a second hinge arm which can be rotated with respect to the first hinge arm about a hinge axis, wherein the first hinge arm is arranged by means of a bolt on a support means which is provided to support a torque when the hinge arms are rotated relative to one another, in that the bolt engages through an aperture in the first hinge arm and is fixed by means of an elastic press fit in a through-hole of the support means. The present invention additionally relates to a motor vehicle having such a drive arrangement, to a bolt for such a drive arrangement, and to a method for mounting the drive arrangement.
