Abstract (en)

[origin: WO2015128790A1] The invention regards a method for the generation of a system and a contextualised training and performance support system for company control processes, in particular production and control processes where the method provides in combination the execution of a process management programme in which the said processes are described and codified according to standard notations, gathered in a process database and organised and activated and synchronised according to pre-established sequences, that is, according to pre-established workflows of the processes and of activities relative to said processes, that is, of so-called tasks and of activities relative to said tasks, that is, steps. The method and the system are characterised by the fact that it decomposes processes into tasks, into rules of sequencing of tasks and into task execution software applications; it decomposes said tasks into steps and into rules of sequencing of these; It generates a database of tasks, and possibly steps, with associated rules for the sequencing of their execution and associated relative software applications; it generates information and/or document libraries regarding the mode of execution of the specific task and/or step relative to the mode of execution of the specific task and/or step; it selects a process and generates the list of tasks of the said process in the correct sequence of execution
