Abstract (en)  
[origin: CN106319698A] The invention relates to a method for operating a spinning unit of a spinning machine. After spinning the fibrous material (2) onto the spinning unit (1) on the spinning zone, monitoring on at least one yarn parameter is performed when a yarn (4) passes through the yarn monitoring unit (3), and then the yarn is wound onto the spool (6) by means of a coiling device (5) and with reference to a predetermined take-up parameter; upon monitoring that a particular yarn parameter is significantly different from at least one of the ratings, the spool and / or spinning zone in the coiling device (5) interrupts the normal operation of the spinning zone during downtime and makes at least temporary changes to one or more take-up parameters after the start of the interrupt sequence, thus simplifying subsequent winding process of the yarn segments wound on the spool (6) before the winding device (5) is stopped in the frame.
