Abstract (en)

[origin: WO2015132574A1] A method of manufacturing a security document comprising a fibrous substrate is disclosed. The method comprises: (a) providing a fibrous substrate formed by deposition of fibres onto a porous support, the fibrous substrate comprising a first integral feature formed during the formation of the fibrous substrate, the first integral feature being a window feature comprising: an aperture through at least a portion of the thickness of the fibrous substrate, through which an insert incorporated within the fibrous substrate is exposed, and/or an aperture through the full thickness of the fibrous substrate; (b) detecting from the fibrous substrate the location of the window feature on the fibrous substrate; and (c) applying a security feature to the fibrous substrate and/or the insert at a position referenced to the detected location of the window feature, such that the security feature and the window feature are registered to one another.
