Abstract (en)

[origin: WO2015132771A1] The invention relates to a safety apparatus substantially consisting of a trapezoidal strap and a receiving element (12) connected to the trapezoid, and a connecting element (10) interacting with the receiving element (12), wherein the receiving element (12) has a receiving region (14) which encloses a cavity (15) accessible via an opening region (14a), wherein the opening region (14a) is adjoined by a securing region (14b) which likewise encloses the cavity (15), wherein a region (18) of overlap is provided in the securing region (14b) and said region (18) is therefore smaller in size than the connecting element (10), but is dimensioned in such a manner that a free 360 degree rotational movement about a solid angle alpha of the connecting element (10) and of a joining element (11), which is connected to the connecting element (10) and protrudes out of the securing region (14b), is possible.
