Abstract (en)

[origin: WO2015120205A1] A steel sheet comprising, in wt%, $0.04 \leq C \leq 0.30$, $0.5 \leq Mn \leq 4$, $0 \leq Cr \leq 4$, $2.7 \leq Mn+Cr \leq 5$, $0.003 \leq Nb \leq 0.1$, $0.015 \leq Al \leq 0.1$ and $0.05 \leq Si \leq 1.0$, has a chemistry that makes hot formed sheet after austenization insensitive to cooling rate and ensures a uniform distribution of tensile strength, in the range of 800-1400 MPa, across parts independent of the time delay between operations and final cooling/quenching. As a result, a formed part can be cooled while inside a die or in air. The addition of Nb reduces the amount of C needed to achieve a given tensile strength and improves weldability.
