Abstract (en)

[origin: WO2015132270A1] The invention relates to a method for determining a loading weight (B) of an oscillating system (16) of a domestic appliance (1) for treating items of laundry (4), in which method oscillations of the oscillating system (16) are damped against an appliance housing (6) of the domestic appliance (1) by means of at least one shock absorber (10, 11), and in which method measured values are provided by means of a displacement sensor (17), which measured values indicate a displacement of the oscillating system (16) with respect to a reference position, and the determination of the loading weight (B) takes place by means of a control device (14) using the measured values, wherein a temporal sequence of the measured values is evaluated by the control device (14) during a loading operation of the oscillating system (16) and slipping of the shock absorber (10, 11) during loading of the oscillating system (16) is detected using the temporal sequence, wherein a change value (24), caused by the slipping, of the displacement is determined by the control device (14) and is compensated for in the determination of the loading weight (B).
