Abstract (en)
[origin: WO2015132124A1] The invention relates to a device for cooling a circulated fluid, comprising an air-permeable heat exchanger (1), which has a feed (5) and a discharge (4) and through which the fluid can be conducted, a fan (15) arranged on the heat exchanger (1) for producing an air flow to be conducted through the heat exchanger (1), and a collecting container (6), which is connected to the discharge (4) of the heat exchanger (1) and in which a filter (10) is arranged, which is connected to a return line (14), wherein a jacket (7) that surrounds the interior of the collecting container (6) consists of a segment of an extruded profiled pipe.
