Abstract (en)

[origin: EP3115495A1] With the present invention, there is provided a washing and/or drying device comprising at least one body; at least one body base (G) located at that part facing a floor where the body is situated; at least one chamber which is located in the said body and in which stuff is put and washing/wringing/drying processes are performed; and at least one damper (S) which absorbs the movement of the said chamber during the washing/wringing/drying processes, and at least one end of which is connected to the said chamber and at least another end thereof is connected to at least one connecting region (K) of the said body base (G). The device comprises at least one plastic supporting piece (P) for preventing strike of the connecting region (K) thereto and making noise during the operation of the washing and/or drying device, which piece is located such that it is in contact with the connecting region (K), so as to prevent rotational movement of the connecting region (K) which may result from the force exerted on the chamber while the damper (S) is absorbing the movement of the chamber.
