Abstract (en)

[origin: WO2015135568A1] A water application device (10, 100) may include a main body (20, 110) graspable along a handle portion thereof by an operator and an operable member (30, 140). The main body (20, 110) may house a flow control assembly (50) configured to enable the device to execute a control function relative to flow of water through the device. The operable member (30, 140) may be attachable to the main body (20, 110) to interface with the flow control assembly (50) to alternately provide flow and stop flow based on a position of the operable member (30, 140). The operable member (30, 140) may have a length extending substantially parallel to an axis of the handle portion. The operable member (30, 140) may interface with a locking member (144) disposed at a first surface of the operable member (30, 140). The first surface may face away from the main body (20, 110). The locking member (144) may be configured to enable the operator to lock the operable member (30, 140) in a flow provision state based on positioning the locking member (144) in a locked state. The locking member (144) may be configured to move between the locked state and an unlocked state via movement relative to the first surface in a direction substantially perpendicular to the axis (118) of the handle portion (22, 119).
