Abstract (en)

[origin: WO2015136033A1] The invention relates to a device for drying printed containers (2), comprising a drivable transport element (3) with container handling stations (4), wherein the containers accommodated on the container handling stations (4) are moved by the transport element (3) on a movement path between at least one container feed (5) and at least one container discharge (6), with the container handling stations (4) assigned to drying and curing devices (7) to bring about a drying reaction on the printed containers (2). The invention is characterized in that there is at least one sensor (8) which is designed to determine the heat energy that is emitted from the container (2) undergoing the drying reaction.
