Abstract (en)

[origin: CN106347786A] The packaging machine (10) has at least one servo drive for driving at least one movable member, wherein a) the servo drive is automatically disengaged from the drive motor (10). The first operating mode is transferred to the second operating mode when a torque, in particular a minimum torque of a predetermined magnitude, is applied by an operator to the shaft of the servomotor of the servo drive while the servo drive is in the first operating mode, or b) the servo drive is automatically transferred from the second to the first operating mode when the shaft of the servomotor of the servo drive is brought into a predetermined desired rotational position, in particular by means of a mechanical or electronic hand wheel (28), which is coupled to the shaft.
