Abstract (en)
A lock (1) for a sliding door (2), comprises a containing box body (3), suitable for being housed in a cavity (4) of an abutting edge (5) of the door (2); a hooking element (6) suitable for engaging with a retaining unit (7) mounted on a jamb (8) in a position facing the abutting edge (5); driving means (9, 10, 11A, 11B) for moving the hooking element (6) from a retracted position (P R) in the containing box body (3) - that permits a free sliding movement of the sliding door (2) along an opening/closing direction (D) - to a prominent engagement position (P P), in which the hooking element (6) protrudes outside the box body (3) to hook onto the retaining unit (7) and prevent opening of the sliding door (2). The driving means (9, 10, 11A, 11B) is configured for giving the hooking element (6) a linear protrusion/retraction movement along a first rectilinear trajectory (T1) that is parallel to the opening/closing direction (D) of the door (2), and a second linear engagement/release movement along a second rectilinear trajectory (T2) that is transverse to the opening/closing direction (D).
