Abstract (en)  
[origin: WO2015139677A1] The invention relates to a window fitting that hinders break-ins. It is known that the system for locking the window comprises the security strike plate, which is mounted on the window frame, and locking pins or mushroom pins, which are mounted on the sash of the window. However, it is necessary to provide a large number (up to 8) of fittings in order ensure security. In order to increase the security and simultaneously reduce the number of fittings, pocket-shaped security plates and bent locking pins are designed. The window fitting that hinders break-ins can be installed in any window.
