Abstract (en)

[origin: WO2015145276A1] The invention relates to a mask (1) including a basic structure (2) and at least one screen (3). The basic structure (2) has at least four through-holes (8) in the receiving surface of the screen (3), each hole having, along the length thereof, at least two enlargements spaced apart from one another, forming chambers having a larger cross-sections than the hole, one of the enlargements being located at a greater depth in the hole (8) and the other enlargement being located at a shallower depth in said hole. The screen (3) comprises at least four fingers (12) projecting from the inner surface thereof, which are arranged in alignment with the holes (8) and which comprise a widened portion (12a) suitable for insertion in either said enlargements. The insertion of all of said widened portions (12a) in all of said intermediate enlargements achieves a stable positioning of the screen (3) spaced apart from said receiving surface, such as to form a ventilation slit between the inner surface of the screen (3) and said receiving surface.
