Abstract (en)
[origin: WO2015145385A1] Bending machine comprising a fixed frame (3a, 3b, 4) and a movable body (1), the latter being able to be tilted and being able to reach both a vertical and a horizontal machining position. This bending machine allows machining to be carried out also in situations of limited space, for example in small workshops. Moreover, it allows to avoid that the result of the machining is negatively affected by the weight of the piece/profile (12). The distribution of the mass in the movable body (1) may be of various type to obtain different advantages. A locking system (5, 6, 7, 15) is advantageously provided to lock the movable body (1) in the vertical position or in the horizontal position with respect to the fixed frame (3a, 3b, 4).
