Abstract (en)
[origin: WO2015144537A1] What is described is a self-locking lock for a door or a window having a movably mounted leaf/casement, having a lock mechanism which is mounted in a lock case 1k, and having a bolt 5a and a latch 5b which interact with a control member 5d and a blocking member 5e. It is provided that the control member 5d interacts with the blocking member 5e in such a way that, depending on the position of the control member 5d, the blocking member 5e can be coupled to the latch 5b, and that the latch 5b interacts with the blocking member 5e in such a way that, starting from its position in which it can be coupled to the latch 5b, the blocking member 5e, by moving out the latch, is taken along from its position in which it blocks the bolt 5a into its position in which it does not block the bolt 5a.
