Abstract (en)

[origin: WO2015144310A1] The invention relates to a method for determining a first hydraulic variable (Q) of a pump assembly (1), which is operated at a predefinable rotation speed (n_o), from a mechanical or electrical variable (M_{act}, P_{el}, n_{act}) by evaluating a combination of the hydraulic variable (Q) with the mechanical or electrical variable (M_{act}, P_{el}, n_{act}). In this case, an actuating variable (M_{target}, n_{target}) of the pump assembly (1) is acted on by a periodic excitation signal ($f_A, n(t), f_A, H(t)$) of a specific frequency (f) in such a way that a second hydraulic variable ($H, \Delta p$) is modulated. The current value of the first hydraulic variable (Q) is then determined from the mechanical or electrical variable ($M_{act}(t), P_{el}(t), n_{act}(t)$) as a system response ($X(t)$) to the excitation signal ($f_A, n(t), f_A, H(t)$) using the combination. The invention further relates to a pump electronics system and to a pump assembly which are designed to carry out the method.
