Abstract (en)

[origin: EP3124791A1] Lightning transmission device between the rotor and the nacelle in a wind turbine, which comprises: a first electricity conductor platen (1), where one of its ends is separated at a distance with respect to a metal strip (4) located at a root of each blade; a second electricity conductor platen (2), where one of the ends is separated a distance with respect to a gutter element (5); electrical conductor means between the first and second platens (2); an electrical insulator (6) coupled to said first and second platens (2); which is also coupled to the hub (3) of said wind turbine; and relative displacement means between the first and second platens (2), said means configured to ensure a predefined distance between the end of the first platen (1) and the metal strip (4); and between the end of the second platen (2) and the gutter element (5).
