Abstract (en)

[origin: WO2015150849A1] The invention relates to a document (1) which is provided with a device for securing confidential information mentioned in the document, the latter comprising: a window (8) cut into said document; at least two structural weakness areas (11, 12) located adjacent to two edges (81, 83) of the window (8); an information medium formed by at least one first label (16) attached to one surface (18) of the document (1) such that the confidential information printed on said label (16) is located level with the window (8); an element (3) for masking the information, with dimensions at least equal to those of the window (8), permanently secured to the structural weakness areas (11, 12) and removably mounted in the window (8). A second label (19), suitable for protecting the first label (16) and for allowing the confidential information to be read when the masking element (3) is lifted, is arranged in the window (8) of the document (1), from the surface (20) of the document (1) opposite the surface (18) which is provided with the first label (16), the dimensions of said second label (19) being smaller than those of the window (8). The masking element (3) is also located on the surface (20) of the document and furthermore has dimensions that enable the element to be permanently secured, by all the sides thereof, to the document adjacent to all the edges of the window (8), including those which lack structural weakness areas (11, 12). The invention also relates to a method for implementing such a document.
