Abstract (en)
[origin: WO2015150147A1] The invention relates to an apparatus for lifting an arrangement along an elongate component (13), having a closed clamping chain (21) with a longitudinal direction (L), wherein at least two movable groups of clamping elements (40, 41) are arranged on the clamping chain (21) and the clamping elements (40, 41) of each group are spaced apart by a fixed distance relative to clamping elements (40, 41) of the same group and the clamping elements (40, 41) of different groups can be moved relative to one another in the longitudinal direction (L) and the clamping elements (40, 41) of each group together form a variable-size clamping cross section, wherein, in at least one cross section of the clamping chain (21), in a direction perpendicular to the longitudinal direction (L), clamping elements (40, 41) of different groups are arranged on the clamping chain (21).
