Abstract (en)

[origin: EP3127844A1] An object is to reliably prevent a yarn from being loosely wound on a package, while reducing the possibility that the operation of catching a yarn end portion takes a long time. When a signal indicating the absence of the running yarn (Y) is output from a yarn clearer (22) or from a yarn feeler (19) during formation of the package (P), a unit controller (33) controls a winding portion (13) to keep rotating the package (P) for a predetermined continuous rotation period while increasing the rotation speed of the package (P).
