Abstract (en)

[origin: WO2015158445A1] An apparatus and method for sound-based environment detection are proposed. The method comprises the following steps: isolation of a first signal element ($s_j(t)$), which potentially comprises a useful signal, from a received signal ($r(t)$), isolation of a second signal element ($s_{i1}(t)$), which is different from the first signal element and potentially comprises an interference signal, from the received signal ($r(t)$), subtraction of the second signal element ($s_{i1}(t)$) from the first signal element ($s_j(t)$), and comparison of the difference with a threshold value. This results in the rating of a received signal for whether its quality is suitable for evaluating environment information.
