Abstract (en)
[origin: US2015295774A1] A system for topology state tracking includes a client device requesting network topology information, and a topology engine coupled to one or more network device. The topology engine includes at least one processor, and non-transitory computer readable media having encoded thereon computer software having a set of instructions executable by the at least one processor to perform one or more operations. The set of instructions includes instructions to receive state information associated with at least one network service, generate network topology information based on the state information, determine changes in the network topology for the at least one network service, update the network topology information, provide access to the network topology information by the client device, receive a request for network topology information from the client device, and transmit the network topology information to the client device.
