Abstract (en)
[origin: CN106661576A] The present invention includes compositions and methods for making and using a RNAi capable of reducing expression of two or more genes, comprising: a first RNAi molecule that reduces the expression of a first target gene; a second RNAi molecule that reduces the expression of the first or a second target gene; and optionally a third RNAi molecule that reduces the expression of the first, the second, or a third target gene, wherein the RNAi molecules reduce the expression level of, e.g., mutated KRAS, SRC-3, EGFR, PIK3, NCOA3, or ERalpha, and can be, e.g., miRNAs, shRNAs, or bifunctional shRNAs.
