Abstract (en)
[origin: WO2015162297A1] The data cable (2) is used for high-speed data transmission at signal frequencies of > 10 GHz and comprises at least one core pair (4) which is surrounded by a film-like pair shield (6) which has an inner shielding film (14) and an outer shielding film (16) which are in electrical contact with one another, wherein the inner shielding film (14) is wound around the core pair (4). By virtue of this measure, an undesired resonance effect is avoided which, in previously wound pair shields, has not allowed use for relatively high signal frequencies. At the same time, an undesired common-mode signal, which would occur in the case of a longitudinally folded shielding film, is thus suppressed.
