Abstract (en)
[origin: WO2015162376A1] The invention relates to a method for managing the representation of data segments of content received by a terminal from a server, the method comprising a step of obtaining a document from which universal addresses are generated, one address being associated with a representation of the segment in question selected by the terminal among a plurality of representations described in the document, the segment being capable of being received from the server and decoded by the terminal, characterised in that it includes the following steps at the terminal: a step of transmitting a request to access at least one segment according to a first selected representation, and a step of receiving said at least one segment according to a second representation, as well as information relating to the second representation suitable for being taken into consideration for decoding the received segment.
