Abstract (en)
[origin: EP3135220A1] Adjunct materials for delivery to liver tissue are provided. In general, the adjunct materials can be configured to be delivered to tissue by deployment of staples from a cartridge body of a surgical stapler. The adjunct material is configured to transition from an unexpanded configuration to an expanded configuration after delivery thereof to the liver tissue. The adjunct material can include an effective amount of one or more medicants, such as a hemostatic agent or a tissue healing agent, disposed within and releasable from the adjunct material for delivery to the liver tissue. The adjunct material can expand to apply pressure to liver tissue to facilitate sealing of one or more fractures in the stapled liver tissue. Methods of using a staple cartridge assembly or an end effector to apply such adjunct materials to liver tissue are also provided.
