Abstract (en)
A machine for filling containers (2) is provided with a plurality of handling units (13), each of which has a filling valve (20) and a filling head (24), which defines, together with the filling valve (20), a supply path for a pourable product into a relative container (2), is coupled in an angularly fixed manner to a support device (32) for receiving and retaining a relative container (2), and is coupled, further, in a rotary and fluid-tight manner to the filling valve (20) by interposing a mechanical gasket (38) having a first ring (40) angularly fixed to the filling valve (20) and a second ring (39) angularly fixed to the filling head (24); a washing device (43) being provided for washing the mechanical gaskets (38) of the handling units (13) so as to remove the residuals of the pourable product from the mechanical gaskets (38) itself.
