Abstract (en)

[origin: WO2015167605A1] A flexible resealable label to cover a dispensing opening includes a polymeric sheet having flap and base portions. The flap portion has a hinge side and a lifting side. The hinge side is connected to the base portion along a hinge, such that the flap portion can pivot with respect to the base portion about an axis of rotation. In one embodiment, the hinge is defined by a straight line of intermittent cuts, and each cut extends all the way through the sheet thickness, and the line of cuts resides in the hinge axis of rotation. In another embodiment, the flap portion has a hinge side edge defined by a straight line of intermittent cuts. Connecting strips extend from the hinge side edge into the base portion. Each connecting strip terminates at the axis of rotation, and the line of intermittent cuts does not reside in the axis of rotation.
