Abstract (en)

[origin: WO2015169418A1] The invention relates to a control device (23) for a compressed-air-operated brake system (1, 1') of a vehicle according to Claim 1, to a brake system (1,1') having such a control device (23) according to Claim 8 and to a vehicle having such a brake system (1, 1') according to Claim 15. In the prior art, it is known to arrange control devices separately in utility vehicles. It is disadvantageous here that all the control devices have to be connected to one another by means of leads, which entails a high level of outlay and high costs. In addition, a large amount of space is required. In order to solve the problem, a control device (23) is proposed which comprises an axle control module (25) with a control function for modulating a pneumatic pressure for making available a service brake function, and a vehicle movement dynamics sensor unit (27) with acceleration and/or rotational speed sensors which serve for regulating the vehicle movement dynamics of the vehicle.
