Abstract (en)
[origin: WO2015173244A1] The invention relates to a retracting device (1) for furniture, comprising a retracting assembly, which has a retracting spring (40), and comprising a damping device (30), wherein the retracting spring (40) and the damping device (30) are connected indirectly or directly to a coupling element (60), which can be displaced between a parking position and a retraction position, wherein the retracting device moves the coupling element (60) from the parking position to the retraction position at least in some ranges and the damping device (30) damps the displacement motion of the coupling element (60) from the parking position to the retraction position at least in some ranges. In order to enable optimized retraction motion in different ranges of the retraction travel in order to thus ensure reliable closing of the furniture door together with a high level of operating comfort, the retracting assembly has at least one additional retracting element (70) (secondary spring), which applies an additional retracting force to the coupling element (60) from an intermediate position located between the parking position and the retraction position.
