Abstract (en)

[origin: WO2015173511A1] The invention concerns a device (10) for a game of skill consisting of passing an object through a target, comprising a board (12) and a target (14) comprising a through opening (26) through which the object can pass, said target being attached to the board by connecting means configured such that the device can take up a usage position, in which the target extends transversely relative to the board. The invention is characterised by the fact that the connecting means comprise a first connecting element (232) mounted on the board (12) and a second connecting element (234) mounted on the target (14), the first and second connecting elements being configured to be reversibly engaged with each other in the usage position, and disengaged from each other when a force greater than or equal to a predefined threshold is applied to the target when the device is in the usage position.
