Abstract (en)

A material processing apparatus comprising a material processing device operated by a rotary operating device. A primary drive system is coupled to the rotary operating device and is operable to rotate the rotary operating device. A secondary drive system has a rotary drive member and is operable between a driving state and a non-driving state. The apparatus is operable in a primary mode in which the primary drive system rotates the rotary operating device or in a secondary mode in which the secondary drive system rotates the rotary operating device. The rotary drive member is positioned such that its rotational drive axis is co-incident with the rotational axis of the rotary operating device.
