Abstract (en)
[origin: EP3145183A1] This display device is provided with a display unit and a control unit. The display unit projects and reflects, onto a light-transmitting display medium, light expressing an image, to allow the image to be viewed, as a virtual image, by a user. The control unit performs first stereoscopic display processing for causing light respectively expressing a left-eye image and a right-eye image of an object to be displayed, to be projected in the display unit. As a result of this processing, the object to be displayed can be stereoscopically viewed in a three-dimensional image space by the user. Furthermore, the control unit performs second stereoscopic display processing for causing light respectively expressing a left-eye image and a right-eye image of one section included in a pattern, to be projected in the display unit, said pattern heading toward the object to be displayed or toward the vicinity of the object to be display, from a position nearer in the image space in the depth direction than the object to be displayed. This second stereoscopic display processing is performed with respect to each section of the pattern in sequence from the near side to the far side in the depth direction. As a result, the pattern can be stereoscopically viewed in the image space by the user.
