Abstract (en)
[origin: WO2015180943A1] The invention relates to a door handle arrangement (1) for a motor vehicle, said door handle comprising a handle (3) for grasping, and there being at least one mechanical coupling means (11) coupled to said handle and designed to establish a mechanical functional connection between the handle (3) and a door-side locking device (5). Said handle (3) and mechanical coupling means (11) are non-detachably coupled to one another but designed separately such that the handle (3) and mechanical coupling means (11) may be moved relative to one another according to an actuation movement at least such that, as a function of said movement, a force can be applied to a piezo-sensor (20) that is arranged between said handle (3) and coupling means (11).
