Abstract (en)

[origin: EP3150933A1] A humidifying element includes a plurality of humidifying bodies arranged along a first direction to provide gaps among the humidifying bodies, a diffusing member that extends along the first direction and is in contact with the plurality of humidifying bodies, and a casing that houses the plurality of humidifying bodies and the diffusing member on an inside. A water storing section 12 provided above the humidifying bodies to store water is formed in the casing. A plurality of water injection holes 12a are formed on the bottom surface of the water storing section 12. A cylindrical wall surface 12b extending downward from the water injection hole 12a portion is formed on the outer side of the bottom surface of the water storing section 12. A distal end of the cylindrical wall surface 12b and the diffusing member are set in contact. A communication port 12c for causing the inside and the outside of the cylindrical wall surface 12b to communicate is formed in the cylindrical wall surface 12b.
