Abstract (en)

[origin: WO2015185181A1] A dispensing device comprising a container, the receiving space of which contains a dispensable medium which can be extracted via a dispensing element of the device for an extraction process, and having a control body (19), which brings a connecting body (11), guided in a longitudinally displaceable manner in a housing part (9), from an inactive base position to an active extraction position by means of a rotational movement, wherein a media-carrying connection is created between the receiving space and the dispensing element, wherein at least one control part of the control body (19) can be attached to at least one control path (54) of the connecting body (11), wherein when the control body (19) moves rotationally, each control part, as seen in relation to the housing part (9), follows the rotational movement in an axially unchanged manner and brings said connecting body from the base position to the extraction position via each associable control path (54) of the connecting body (11), wherein said control path comprises a slope.
