Abstract (en)
[origin: WO2015189206A1] A device is disclosed for ejecting a furniture part, wherein the device (1) comprises an ejection handle which is mounted on the device and can be driven via a drive unit, and which can be driven out for an ejection process from a start position on the device, such that a bearing section (12, 12') on the ejection handle can be contacted with the furniture part in order to eject the moveably accommodated furniture part in an opening direction. According to the invention, the ejection handle has a projection section (15) which is optionally detachable from the remaining part (17) of the ejection handle along a present separation region, by which means a depth dimension of the ejection handle in the region of the projection section can be preset depending on the presence of the projection section (15) on the ejection handle in such a way that the depth dimension of the ejection handle is reduced, if the projection section (15) is removed, with respect to the depth dimension of the ejection handle if the projection section (15) is not removed.
