Abstract (en)

[origin: WO2015189681A1] In an improved wall structure with or for sliding door or slide-swinging door, a rail section (21) allows a sliding movement of a sliding, or slide-swinging, or folding door (16). A first coupling system (90), located at the first extremity (200) of the rail section (21), interacts with a second coupling system (91) located at a first side (71) of an end closure member (70), coupling the latter to the rail section (21). A third coupling system (92), located at a second side (72) of the end closure member (70) distal from the first side (71), interacts with a fourth coupling system (93) located at a second side (82) of an additional member (80) distal from a first side (81) of the additional member (80) itself. The additional member (80) is either a finishing plug or a connecting part with its first side (81) provided with a related fifth coupling system (94) for coupling the additional member (80) to other parts of the wall structure.
