Abstract (en)  
[origin: WO2015191068A1] A processing device receives a first set of image data comprising one or more chroma channels and a luma channel. The processing device reduces the resolution of the one or more chroma channels to produce one or more reduced-resolution chroma channels. The processing device arranges the luma channel and the one or more reduced-resolution chroma channels into a second set of image data. The spatial coordinates of the luma channel and the one or more reduced-resolution chroma channels do not overlap in spatial location of the second set of image data. The processing device transmits the second set of image data to a downstream device.
