Abstract (en)

A glove for food handling is provided by which, even if the glove for food handling is broken and a broken piece thereof mixes in food, the broken piece can be easily found. The glove main body for food handling is kneaded with a luminescent material that, even if a broken piece K of the glove for food handling mixes in food F, makes the broken piece K emit light in response to ultraviolet rays S by irradiating the food F with the ultraviolet rays S by using an ultraviolet light source L such as a black light. The luminescent material is kneaded throughout the entire area of the glove main body for food handling.
