Abstract (en)
[origin: WO2017064594A1] The aim of the invention is to create a combination of a screw closure and a push-pull closure (1), wherein in particular the metered removal of liquids from the container (4) is desired. This aim is achieved by a closure cap (5), which together with a movable lug-like closure element of the push-pull closure forms a mechanical connection which is disengaged upon opening and is produced again upon closure of the closure cap, such that when the closure cap is unscrewed, the movable lug-like closure element of the push-pull closure is already raised linearly into the open position and when the closure cap is screwed on, the movable lug-like closure element of the push-pull closure is again pressed down into the closed position.
