Abstract (en)

In a invisible hidden door hinge (1), a first connecting body (2a) and a second connecting body (2b) are connected together by an articulation device (3) which allows the relative movement between a condition of opening and a closed condition in which the first (2a) and the second (2b) connecting body define a seat in which the articulation device (3) is enclosed. At least one of the connection bodies (2a, 2b) comprises a support structure (4a, 4b) in which, for a position adjustment, at least one movable body (5a) is housed which is shaped from a respective single metal sheet in a single concave piece, a transversal portion (500a) is bent in three sections (502a, 503a, 504a) to form a housing groove (72) for an adjustment actuator (7).
