Abstract (en)

[origin: WO2016003459A1] A refillable dispenser system, method, and kit are provided. The kit includes a refillable dispenser that includes an applicator, and a body defining a first reservoir in fluid communication with the applicator. The body includes a first end coupled with the applicator, and a second end, opposite to the first end, defining an orifice that is in fluid communication with the first reservoir. The refillable dispenser also includes a closure member coupled with the body, the closure member being operable between a closed position and an open position. In the closed position, the closure member cooperates with the body to substantially prevent fluid from escaping from the reservoir via the orifice. In the open position, the closure member is positioned with respect to the body to allow access to the orifice. The one or more refill cartridges include an opening and define a second reservoir in communication with the opening.
