Abstract (en)
[origin: WO2015192176A1] A foldable tent frame (10) with radial frame members and longitudinal frame members. Two pivot joints (42,44) pivotally engage one end of each of the radial frame members. Corner joints (18 to 32) pivotally connect each of the longitudinal frame members to two of the radial frame members respectively. Axial joints (34-40) in each of the longitudinal frame members respectively allow the longitudinal frame members to fold. The radial frame members rotate from a mutually splayed configuration to a retracted configuration. The longitudinal frame member fold about the axial joints to draw the radial frame members connected to one of the pivot joints adjacent the radial frame members connected to the other pivot joint.
