Abstract (en)

A description is given of a fastening system comprising a profile strip, having a profile wall, which is to be fastened to a surface, as well as a rail plate a first plate portion of which is to be fastened to the profile wall, and the second plate portion, in the fastened state, projects at least partly beyond the edge of the profile wall. A recess for partially accommodating a fastening member is provided at the dividing line between the two plate portions. By virtue thereof, it is not necessary to provide a recess in the edge of the profile wall, thus reducing machining operations and installation time.
