Abstract (en)

[origin: WO2015197242A1] The invention relates to a pressing device (10) for pressing a braided tube (14) onto a component core (16) extending along a core axis (17), comprising at least one pressing roller (12), which loads the braided tube (14) against the component core (16) during the operation of the device (10), characterized in that at least one pressing roller (12) extending transversely to the core axis (17) is provided, which at least one pressing roller is rotatably supported by means of two spherical plain bearings (28), which are spaced apart from each other, in such a way that the spherical plain bearings (28) of the pressing roller (12) can be moved in relation to each other in order to move the pressing roller (12).
