Abstract (en)  
[origin: WO2015200344A1] A latch assembly is provided that includes a housing, a release mechanism and a latch mechanism. The release mechanism includes a handle. Movement of the handle from a retracted position towards an extended position relative to the housing is operable to cause the latch mechanism to change from a latched condition to an unlatched condition. When the latch mechanism changes from an unlatched condition to the latched condition, the latch mechanism is operable to cause the release mechanism to cause the handle to move to the retracted position. When the latch mechanism is in the unlatched condition, the latch mechanism maintains the release mechanism in a configuration that maintains the handle away from the retracted position and provides a visual indication that the latch mechanism is in the unlatched condition.
