Abstract (en)

[origin: US2017124924A1] The invention relates to a hollow body with attractive movement effects. The transparent hollow body is filled with a viscous transparent liquid (F). This body contains two types of small-part bodies used as floating bodies (S) and even smaller-sized bodies as drive bodies (K). The floating bodies (S) have an arbitrary average diameter and the drive elements (K) preferably have a significantly smaller diameter than the floating bodies (S). The density of the material of the floating bodies (S) is always less than that of the material of the drive bodies (K). The hollow body contains two perforated plate plates (3) spaced apart from one another, provided as horizontal intermediate walls, so that the hollow body forms a central sub-chamber as well as an upper and a lower sub-chamber (2) for the plurality of floating and drive bodies (S; K).
